

<Marine Organism Rearing Log>

9 AM, August 5, 2022

Weather: Cloudy

Water temperature: 17.6°C

Training on rearing in normal seawater

The seawater used for rearing, has been filtrated to remove micro-particles through a filter of 100 μm and 10 μm in order to prevent diminishing water quality.

Today, the filters have been replaced with new ones.

In addition, no individuals died from last week for both flounder and abalone.

<Next report will be on August 8>
