

<Marine Organism Rearing Log>

9 AM, September 8, 2022

Weather: Sunny

Water temperature: 18.0°C

pH of regular seawater is near 8.1, however, pH of seawater will be more acidified (pH level will be lower) at the closed rearing environment due to nitric acid level transformed from ammonia keeps raising. Now, it is near pH7.1. It will cause adverse effect on biology so that we add sodium bicarbonate to balance pH level gradually.
