

<Marine Organism Rearing Log>

9 AM, November 21, 2022

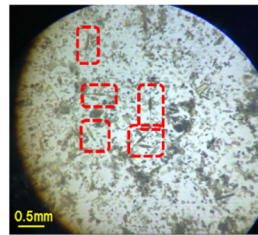

Weather: Cloudy later Sunny

Water temperature: 17.6°C

Flounder's anemia caused by parasites (*Neoheterobothrium hirame*) which we struggled about 6 months ago at rearing training phase. At rearing test, we perform microscope observation once a week but no eggs of parasites are found from either the tanks of regular seawater nor ALPS treated water added. We will stay focused on and continue to rear and observe them.

A flounder which was suffering from anemia caused by parasites (*Neoheterobothrium hirame*) at rearing training.

Eggs of parasites found at rearing training.

A microscope for checking eggs

Healthy flounders (in ALPS treated water added tank)
