

<Marine Organism Rearing Log>

9 AM, December 13, 2022

Weather: Cloudy

Water temperature: 17.6°C

Since circulation flow volume of seawater at rearing training facility is on the decrease, we cleaned the purifying chamber which transform ammonia to nitric acid for year-end cleanup. Also, we cleaned denitrification unit which transform nitric acid to nitrogen gas at the same time. Now, the living environment of the flounders are much more improved.
