

<Marine Organism Rearing Log>

9 AM, May 19, 2023

Weather: Sunny

Water temperature: 18.2°C

We used to feed the flounders daily. However, as they were getting bigger and stronger, we have reduced the number of times for feeding to four times a week since this week. They are flesh-eating fish so it is rare for them to eat every day under normal conditions, like for lions or tigers in nature. Although the frequency of feeding has been reduced, we have increased the amount of feed.

<Next report will be on May 22, 2023>

The number of dead abalones and removed for research				
	No. of dead abalones		Removed for research	
	5/12 – 5/18 (No.)	Survival Rate (%, accumulated)	5/12 – 5/18 (No.)	Accumulated (No.)
Regular seawater①	1	75.5	0	0
Regular seawater②	4	74.8	0	0
ALPS treated water added①	0	70.8	0	0
ALPS treated water added②	3	65.5	0	1

* For accuracy, counted from Friday of the previous week to Thursday.
* No dead flounders
