

<Marine Organism Rearing Log>

9 AM, June 6, 2023

Weather: Sunny

Water temperature: 18.6°C

We will talk about the procedure of measuring flounders today.

The measuring procedure is as follows:

1. Take out all the flounders and place them in one specific tank, and move several of them at a time to an anaesthesia bath that also serves as a salt water bath.
2. Once anesthesia has taken effect, check for parasites and disinfect the pharynx with salt, and then measure the length and weight.
3. After measuring, return the flounders to an empty tank, and wait for awakening.

The whole procedure takes only several minutes per each flounder.
