

<Marine Organism Rearing Log>

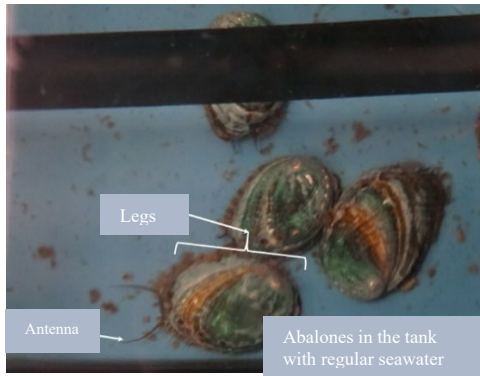

9 AM, June 30, 2023

Weather: Cloudy

Water temperature: 17.9°C

Today is the end of June. We have not talked much about the abalones this month, so today's topic is the current status of the abalones. We have confirmed the abalones' vigor, by (1) their antennae extended, (2) legs protruded from the shells, and (3) their active movement. The abalones are moving around in the tanks in good health today.

<Next report will be on July 3>.

				
The number of dead abalones and removed for research				
	Death	Survival Rate	Removed for research	
	6/23 - 6/29 (No.)	(% Accumulated)	6/23 - 6/29 (No.)	Accumulated (No.)
Regular seawater①	0	73.5	0	0
Regular seawater②	4	66.5	0	0
ALPS treated water added①	4	65.1	0	0
ALPS treated water added②	2	60.1	0	1
* For accuracy, counted from Friday of the previous week to Thursday. * No flounder deaths
