

<Marine Organism Rearing Log>

9 AM, July 10, 2023

Weather: Sunny

Water temperature: 17.9°C

At the test breeding facility, 76 filters for seawater purification are used per week. After use, they must be treated as radioactive solid waste and therefore incinerated and stored as ash. Before incineration, the filters are dried and cut into the desired size with large scissors (cable cutters) in order to make them easier to throw into the furnace.
