

## <Marine Organism Rearing Log>

9:00 AM, July 11, 2023

Weather: Sunny

Water temperature: 17.9°C

It has been about nine months since the start of breeding tests. The concentration of tritium in the breeding tank water has decreased by about 50Bq/l from the initial level of about 1,250Bq/l due to the half-life of tritium (it takes 12.3 years for tritium to decay by half). For this reason, treated water was added last month to keep tritium concentrations at about 1,300Bq/l.
