

<Marine Organism Rearing Log>

9 AM, July 20, 2023

Weather: Sunny

Water temperature: 17.7°C

In the previous log, we showed how filters used to purify breeding water are cut up into pieces after use. By cutting the filters, the amount of filters that can fit in one bag is increased, and the volume is reduced by about half. The filters are packed in bags without wasting space, much like you do at home with household garbage.
