

<Marine Life Rearing Log>

9 AM, September 27, 2023

Weather: Rainy

Water temperature: 18.6°C

In the wild, the highly toxic ammonia contained in the urine of marine organisms is converted to nitrite, then nitric acid, and then finally to nitrogen gas with the help of microorganisms. At the lab, we have an important device that does this to convert ammonia to nitrogen gas, and it's fitted with a transparent cover that protects the on-off switch to prevent accidental operation.
