

<Marine Organism Rearing Log>

9 AM, December 8, 2023

Weather: Sunny

Water temperature: 18.6°C

Although the gill pups and the parasite parent worms in the oral cavity can be exterminated by the treatment we showed you yesterday, parasite eggs and hatching larvae still remain in the tank. We will perform the procedure again when they start attaching themselves to the gills.

<Next report will be on December 11>

In the tanks of rearing training facilities located outside the controlled area
**No parasites have been found in the tanks where the rearing tests are being conducted*

Life stages of parasites that can be eliminated with a single anesthesia and salt water bath
 (The treatment is performed again before the hatchlings mature)

The number of dead abalone / removed for research

	No. of dead abalone		Removed for research	
	12/1-12/7 (No.)	Survival Rate (% accumulated)	12/1-12/7 (No.)	Accumulated (No.)
Regular seawater ①	5	42.6	0	0
Regular seawater ②	2	36.1	0	0
ALPS treated water added ①	1	44.8	0	0
ALPS treated water added ②	2	37.4	0	2

* No flounder deaths

* For accuracy, counted from Friday of the previous week to Thursday
