

Fukushima Daiichi Nuclear Power Station

Commencement of the Unit 2 fuel debris trial retrieval

- Now that the push pipes have been put in their correct order and TEPCO has completed its check, trial retrieval has recommenced on September 10.
- On September 10, connection of push pipe① to the guide pipe (inner sleeve) and opening of the isolation valve were conducted. By inserting the guide pipe, the end jig of the telescopic device passed through the isolation valve at 7:20 a.m., marking the commencement of the trial retrieval.
- We will continue to remain vigilant and prioritize safety as we aim to complete decommissioning.
