Decommissioning Engineering Company

- Fuel in the spent fuel pool in the Unit 2 reactor building will be removed using a fuel handling machine that will run along the fuel removal work platform built on the south side of the reactor building.
- Since October 24, 2024, we have been building a runway girder that will serve as the foundation for rails upon which the fuel handling machine will move, and we hereby announce that this construction was completed on March 14, 2025.
- We will continue to work safely and purposefully towards our objective of commencing fuel removal from the Unit 2 spent fuel pool by FY2026.

Installed runway girder

(Photographed at around 12 PM on March 14 from the fuel removal work platform, some parts of the photo have been altered for security reasons)
