## Fukushima Daiichi Nuclear Power Station Plant Parameters

As of 11:00 on July 29 2019

## [Note]

Some indicators might not be functioning properly beyond the normal condition for usage affected by the earthquake and subsequent events. We comprehensively evaluate situation in plants using all the available information from indicators and also focusing on trends, taking uncertainty of indicators into consideration.

[Information about measurements]

<sup>\*\*1 :</sup> In case that the instrument indicates minus hydrogen density, "0%" is recorded. (Because there's the possibility of minus indication due to the instrumental precision when hydrogen density is very low.)
The hydrogen concentration in the PCV gas control system is provided.

<sup>\*\*2:</sup> In case that the instrument reading is below measurable limit, "ND" is recorded. The radioactivity density (Xe135) in the PCV gas control system is provided.

<sup>%3:</sup> Flow rate values are adjusted according to the temperature and the pressure under usage conditions.

<sup>\*4 :</sup> Nitrogen gas injection is under suspension.

<sup>※5:</sup> The primary coolant pump in the Unit 4 spent fuel pool is now suspended.

<sup>%6 :</sup> Change of the nitrogen injection amount (PTW)

<sup>\*7:</sup> Data missing due to work interrupting the measurement.
