

Nuclide Analysis Results of Radioactive Materials in the fallout around the site of Fukushima Daiichi Nuclear Power Station

	Place of Sampling		Time of Sampling		Detected Nuclides (B q / m ²) (Half-life)		
			From	To	I-131 (about 8 days)	Cs-134 (about 2 years)	Cs-137 (about 30 years)
Fukushima Daiichi NPS		Environment Management Building	2012/1/5 11:20	2012/2/1 10:20	ND	5200	7000
Fukushima Daini NPS		Administration Office Building	2012/1/5 10:20	2012/2/1 10:30	ND	190	260

$Bq / m^2 = MBq / km^2$

"ND" means the sampled data is below the measurable limit (I-131:approx. 140Bq/m²).

However, it could be detected sometimes even when they are below the limits due to the difference of detector and sample condition.
