(Data summarized on February 11)

* The radioactivity density is the sum of the volatile nuclides density and the particulate nuclides density.

O.OE-O is the same as $O.O \times 10^{-O}$

Data of other nuclides is under examination.

* In the case of more than 2 nuclides, the sum of scaling factors to density limits is compared to 1.

* "ND" indicates that the measurement result is below the detection limit.

The detection limits at the west gate of Fukushima Daiichi NPS are as follows: Volatile: I-131: Approx. 8E-8Bq/cm3, Cs-134: Approx.2E-7Bq/cm3, Cs-137: Approx.2E-7Bq/cm3 Particulate: I-131: Approx. 4E-8Bq/cm3, Cs-134: Approx.9E-8Bq/cm3, Cs-137: Approx.1E-7Bq/cm3 As the detection limit may vary depending on the detectors and sample properties, there are cases where nuclides below the detection limit are detected.
