

Levels of monitoring parameters during the nitrogen injection test at Unit 1 in Fukushima Daiichi NPS (as of 11:00 AM on July 8)

<Reference>

July 8, 2013

Tokyo Electric Power Company

Nitrogen injection amounts were changed on Jul. 3 (at 10:18 AM)
 (PCV side: Decreased from 6Nm³/h to 0Nm³/h, exhaust amount:
 Decreased from 27.3Nm³/h to 21.4Nm³/h)

D/W HVH temperatures among temperatures inside PCV, which are monitoring parameters, have been changing within narrow ranges, and have not shown significant changes.

The other monitoring parameters (such as xenon density and hydrogen density) have not shown significant changes.

<http://www.tepco.co.jp/en/nu/fukushima-np/f1/pla/index-e.html> ("The parameters related to the plant" in the TEPCO website)

We have evaluated that the nitrogen injection test of the amount from the PCV side to the RPV side was performed without any problem, since no abnormal indication of the plant data was found. Therefore, enhancement of the monitoring was completed as of 11:00 AM on July 8.

Thermometers Related to the Technical Specification at Unit 1 in Fukushima Daiichi NPS
