Compensation amount calculation for depreciable assets
Based on the book value of each account, the asset value at the time of the accident is calculated by multiplying certain correction (alter to straight-line method from declining-balance method, set the lower limit of salvage value to 20\%) in consideration of utility value after depreciation.

For the purpose of taking the hassle out of compensation application, the depreciable asset coefficient is set according to the ratio of undepreciated balance (ratio calculated by dividing the book value of each account by the acquisition cost) to allow the calculation for multiple depreciable assets of different useful lives to be summarized per account.
